Chita thermal power station. With a capacity of 3,996MW, the Chita thermal power station is located in Chita, Aichi, Japan. It was owned and operated by Chubu Electric Power Company since operations began in 1968 – although in April 2019 control was transferred to JERA, a joint-venture between Chubu Electric and Tokyo Gas. The power plant comprises six LNG-fired units. In 1985, the first four units, which were originally designed to burn heavy crude oil, were modernised to generate power ...

A gas-fired power plant or gas-fired power station or natural gas power plant is a thermal power station which burns natural gas to generate electricity. Natural gas power stations generate a quarter of world electricity and a significant part of global greenhouse gas emissions and thus global warming. However they can provide seasonal dispatchable generation to balance variable renewable energy where hydropower or interconnectors are not available.

A simple cycle gas turbine achieves energy conversion efficiencies from 20 to 35%. Typical coal-based power plants operating at steam pressures of 170 bar and 570 °C run at efficiency of 35 to 38 %, with state-of-the-art fossil fuel plants at 46% efficiency. Combined-cycle systems can reach higher values.

The turbine's hot exhaust powers a steam power plant (operating by the Rankine cycle). This is a combined cycle gas turbine (CCGT) plant. These achieve a best-of-class real (see below) thermal efficiency of around 64% in base-load operation. In contrast, a single cycle steam power plant is limited to efficiencies from 35 to 42%.
